

Interview Evaluation Report

Candidate: adarsh tiwari
Interview Type: Data Analyst - python
Date: 2026-06-24 15:44

Performance Summary

Category	Score
Overall Score	20/100
Technical Knowledge	5/25
Communication Skills	5/25
Problem Solving	5/25
Project Understanding	5/25

Strengths

- Basic understanding of data types
- Familiarity with Python
- Awareness of data preprocessing steps

Areas for Improvement

- Improve communication skills for clearer answers
- Gain more experience with statistical analysis in Python
- Develop skills in handling missing data and optimizing memory usage

Suggestions

- The candidate needs to work on providing clear and concise answers, and demonstrate more experience with data analysis and statistical techniques. It's also essential to be prepared to answer questions related to the projects mentioned in the resume, and to show a deeper understanding of the tools and technologies used in the field.

Interview Questions & Answers

Q1: What data preprocessing steps did you take in Excel to prepare the data for the Amazon Dashboard project?

Answer: hi lisa so i just do the data preprooting step using x not to the excel i just provide with the python so i don't have much more the idea of excel

Score: 2/10 | Feedback: User lacks understanding of data pre-processing and its relation to Excel, provides vague Python reference without context or clarity

Q2: How did you optimize MySQL data retrieval for better performance in the Global Super Store Dashboard project?

Answer: so i just used mysql for my insights in mobile support dashboard so i probably do using do with the working with the indexes like indexes or the subquery or with the with the clouds to optimize my large query on the complex query with the

Score: 2/10 | Feedback: The user mentions using MySQL and optimizing queries, but the response lacks specificity and clarity. They reference indexes, subqueries, and the cloud, but do not provide a coherent explanation of how these concepts would be applied to optimize a large, complex query. The response appears to be a stream-of-consciousness listing of potential optimization techniques rather than a thoughtful, detailed approach to query optimization.

Q3: When working with Excel data in your Global Super Store Dashboard project, what data types did you typically encounter and how did you handle them in Python?

Answer: basically data set to read we have a much more data like in x excel string integer float and decimal or model so using python we provide you to with the handling using pandas it is much more easier in excel

Score: 4/10 | Feedback: The user's answer is somewhat relevant but lacks specificity and clarity. They mention using Python and pandas for handling data, which is a good approach, but fail to provide concrete details or examples. The mention of Excel and various data types is also relevant, but the connection to the question is not clearly made. Overall, the answer demonstrates some basic understanding of data handling but lacks depth and coherence.

Q4: What strategies do you use to ensure data accuracy in Excel, as seen in your experience with the Amazon Dashboard project?

Answer: (The user skipped this question)

Score: 0/10 | Feedback: The user did not provide an answer to evaluate, so it's impossible to assess their understanding or knowledge of the topic.

Q5: What experience do you have with statistical analysis using Python, and how have you applied it in your projects?

Answer: i have not much more experience with the statistical analysis in using python i just probably use some kind of basic functions like a mean median mode z square or some kind of normalization or the scaling technique that i'm let me use in my project

Score: 2/10 | Feedback: The user has limited experience with statistical analysis in Python, only mentioning basic functions like mean, median, mode, z-score, normalization, and scaling techniques. They lack knowledge of advanced statistical concepts and libraries like Pandas, NumPy, and Scikit-learn.

Q6: What Python libraries have you used for data analysis in the Global Super Store Dashboard project?

Answer: No answer provided

Score: N/A/10 | Feedback: No feedback provided

Q7: How did you handle missing data in the MySQL database used for the Global Super Store Dashboard project?

Answer: No answer provided

Score: N/A/10 | Feedback: No feedback provided

Q8: Describe a time you had to analyze a large dataset, like the one in the Amazon Dashboard project, to extract insights using Power BI and Excel.

Answer: No answer provided

Score: N/A/10 | Feedback: No feedback provided

Q9: How do you optimize memory usage in Python when working with large datasets, such as those encountered in your machine learning projects like the Global Super Store Dashboard?

Answer: No answer provided

Score: N/A/10 | Feedback: No feedback provided

Q10: Design an analysis to determine customer churn using the data from the Amazon Dashboard project and your skills in MySQL and Excel.

Answer: No answer provided

Score: N/A/10 | Feedback: No feedback provided
